Sequence Data 的分析(1) Time Series

Time Series

https://en.wikipedia.org/wiki/Time_series

一組按照時間發生先後順序進行排列的數據點序列。

通常一組時間序列的時間間隔為一恆定值（如1秒，5分鐘，12小時，7天，1年），因此時間序列可以作為離散時間數據進行分析處理。

時間序列廣泛應用:
數理統計、
信號處理、
模式識別、
計量經濟學、
數學金融、
天氣預報、
地震預測、
腦電圖、
控制工程、航空學、通信工程以及絕大多數涉及到時間數據測量的應用科學與工程學。

The Most Comprehensive List of Kaggle Solutions and Ideas

This is a list of almost all available solutions and ideas shared by top performers in the past Kaggle competitions. This list will get updated as soon as a new competition finished. If you find other solutions beside the ones listed here I would suggest you to contribute to this repo by making a pull request. The symbols were used in this list is described here.
If you found it interesting you can give a star or make a fork

NLP

NLP Natural Language Processing 自然語言處理

https://zh.wikipedia.org/wiki/自然語言處理

- 自然語言處理（Natural Language Processing，NLP）是人工智慧和語言學領域的分支學科。
- 此領域探討如何處理及運用自然語言；自然語言處理包括多方面和步驟，基本有認知、理解、生成等部分。
- 自然語言認知和理解是讓電腦把輸入的語言變成有意思的符號和關係，然後根據目的再處理。**自然語言生成系統**則是把電腦資料轉化為自然語言。

Chinese Word Segmentation中文分詞

https://github.com/fxsjy/jieba

支持繁體分詞
支持自訂字典
MIT 授權協議

支持三種分詞模式：

全模式，把句子中所有的可以成詞的詞語都掃描出來, 速度非常快，但是不能解決歧義；

精確模式，試圖將句子最精確地切開，適合文本分析；

搜索引擎模式，在精確模式的基礎上，對長詞再次切分，提高召回率，適合用於搜尋引擎分詞。

jieba
“結巴”中文分詞：做最好的 Python 中文分片語件
"Jieba" (Chinese for "to stutter") Chinese text segmentation: built to be the best Python Chinese word segmentation module.

```
import jieba

sent = '中文分詞是文本處理不可或缺的一步！'

seg_list = jieba.cut(sent, cut_all=True)
print('全模式：', '/ ' .join(seg_list))

seg_list = jieba.cut(sent, cut_all=False)
print('精確模式：', '/ '.join(seg_list))

seg_list = jieba.cut(sent)
print('預設精確模式：', '/ '.join(seg_list))

seg_list = jieba.cut_for_search(sent)
print('搜尋引擎模式', '/ '.join(seg_list))
```

```python
import jieba

sent = '中文分詞是文本處理不可或缺的一步！'

seg_list = jieba.cut(sent, cut_all=True)

print('全模式: ', '/ '.join(seg_list))

seg_list = jieba.cut(sent, cut_all=False)
print('精確模式: ', '/ '.join(seg_list))

seg_list = jieba.cut(sent)
print('預設精確模式: ', '/ '.join(seg_list))

seg_list = jieba.cut_for_search(sent)
print('搜尋引擎模式', '/ '.join(seg_list))

```

```
全模式： 中文/ 分/ 詞/ 是/ 文本/ 處/ 理/ 不可/ 不可或缺/ 或缺/ 的/ 一步/ /
精確模式： 中文/ 分詞/ 是/ 文本/ 處理/ 不可或缺/ 的/ 一步/ ！
預設精確模式： 中文/ 分詞/ 是/ 文本/ 處理/ 不可或缺/ 的/ 一步/ ！
搜尋引擎模式 中文/ 分詞/ 是/ 文本/ 處理/ 不可/ 或缺/ 不可或缺/ 的/ 一步/ ！
```

搜索引擎模式，在精確模式的基礎上，對長詞再次切分，提高召回率，適合用於搜尋引擎分詞。

詞性標註Part-of-speech tagging

http://terms.naer.edu.tw/detail/1678982/

字詞（**word**）是語言系統中具有獨立語意或扮演特定語法功能，
且可以自由使用的最小語言單位。

依據字詞在句法結構或語言形態上扮演的角色，
經由詞性分類賦予語句中每個字詞適當之詞性符號或標記的過程，
則稱為詞性標記（**part-of-speech tagging**，或稱**POS tagging**）。

隨著語言的不同，詞性分類的方式也有所差異。
基本上可分為動詞（**verb**）、名詞（**noun**）、形容詞（**adjective**）、副詞（**adverb**），以及其他類別，例如：代名詞（**pronoun**）、介係詞（**preposition**）、連接詞（**conjunction**）或感嘆詞（**interjection**）

詞性標註Part-of-speech tagging

http://terms.naer.edu.tw/detail/1678982/

詞性標記的範例

Tagging is the task of labeling (or tagging) each word in a sentence with its appropriate part of speech.

Tagging_VBG is_BEZ the_**AT** task_NN of_IN labeling_VBG (_(or_CC tagging_VBG)_) each_DT word_NN in_IN a_AT sentence_NN with_IN its_PP$ appropriate_JJ part_NN of_IN speech_NN ._.

VBG為動名詞或現在分詞，BEZ代表is，AT為冠詞，NN為名詞，IN為介係詞，CC為連接詞，DT為限定詞，PP$為所有格，JJ為形容詞。

NLP Transfer Learning 遷移學習

面向文本分類的通用語言模型微調
Universal Language Model Fine-tuning for Text Classification
Jeremy Howard & Sebastian Ruder
https://arxiv.org/abs/1801.06146

https://kknews.cc/code/6qqggj3.html
https://medium.com/mlreview/understanding-building-blocks-of-ulmfit-818d3775325b

Inductive transfer learning has greatly impacted computer vision, but existing approaches in NLP still require task-specific modifications and training from scratch.

We propose **Universal Language Model Fine-tuning (ULMFiT),** an effective transfer learning method that can be applied to any task in NLP, and introduce techniques that are key for fine-tuning a language model.

Our method significantly outperforms the state-of-the-art on six text classification tasks, reducing the error by 18-24% on the majority of datasets. Furthermore, with only 100 labeled examples, it matches the performance of training from scratch on 100x more data. **We open-source our pretrained models and code.**

Google Transformer(2017)

Attention Is All You Need

Ashish Vaswani, Noam Shazeer, Niki Parmar, Jakob Uszkoreit, Llion Jones, Aidan N. Gomez, Lukasz Kaiser, Illia Polosukhin

(Submitted on 12 Jun 2017 (v1), last revised 6 Dec 2017 (this version, v5))

The dominant sequence transduction models are based on complex recurrent or convolutional neural networks in an **encoder-decoder configuration**. The best performing models also connect the encoder and decoder through an **attention mechanism**.

We propose a new simple network architecture, **the Transformer**, based solely on attention mechanisms, dispensing with recurrence and convolutions entirely.

Experiments on two machine translation tasks show these models to be superior in quality while being more parallelizable and requiring significantly less time to train. Our model achieves 28.4 BLEU on the WMT 2014 English-to-German translation task, improving over the existing best results, including ensembles by over 2 BLEU. On the WMT 2014 English-to-French translation task, our model establishes a new single-model state-of-the-art BLEU score of 41.8 after training for 3.5 days on eight GPUs, a small fraction of the training costs of the best models from the literature. We show that the Transformer generalizes well to other tasks by applying it successfully to English constituency parsing both with large and limited training data.

pytorch-transformers

https://github.com/huggingface/pytorch-transformers

PyTorch-Transformers

PASSED

PyTorch-Transformers (formerly known as `pytorch-pretrained-bert`) is a library of state-of-the-art pre-trained models for Natural Language Processing (NLP).

The library currently contains PyTorch implementations, pre-trained model weights, usage scripts and conversion utilities for the following models:

1. **BERT** (from Google) released with the paper BERT: Pre-training of Deep Bidirectional Transformers for Language Understanding by Jacob Devlin, Ming-Wei Chang, Kenton Lee and Kristina Toutanova.
2. **GPT** (from OpenAI) released with the paper Improving Language Understanding by Generative Pre-Training by Alec Radford, Karthik Narasimhan, Tim Salimans and Ilya Sutskever.
3. **GPT-2** (from OpenAI) released with the paper Language Models are Unsupervised Multitask Learners by Alec Radford*, Jeffrey Wu*, Rewon Child, David Luan, Dario Amodei** and Ilya Sutskever**.
4. **Transformer-XL** (from Google/CMU) released with the paper Transformer-XL: Attentive Language Models Beyond a Fixed-Length Context by Zihang Dai*, Zhilin Yang*, Yiming Yang, Jaime Carbonell, Quoc V. Le, Ruslan Salakhutdinov.
5. **XLNet** (from Google/CMU) released with the paper XLNet: Generalized Autoregressive Pretraining for Language Understanding by Zhilin Yang*, Zihang Dai*, Yiming Yang, Jaime Carbonell, Ruslan Salakhutdinov, Quoc V. Le.
6. **XLM** (from Facebook) released together with the paper Cross-lingual Language Model Pretraining by Guillaume Lample and Alexis Conneau.
7. **RoBERTa** (from Facebook), a Robustly Optimized BERT Pretraining Approach by Yinhan Liu, Myle Ott, Naman Goyal, Jingfei Du et al.

These implementations have been tested on several datasets (see the example scripts) and should match the performances of the original implementations (e.g. ~93 F1 on SQuAD for BERT Whole-Word-Masking, ~88 F1 on RocStories for OpenAI GPT, ~18.3 perplexity on WikiText 103 for Transformer-XL, ~0.916 Peason R coefficient on STS-B for XLNet). You can find more details on the performances in the Examples section of the documentation.

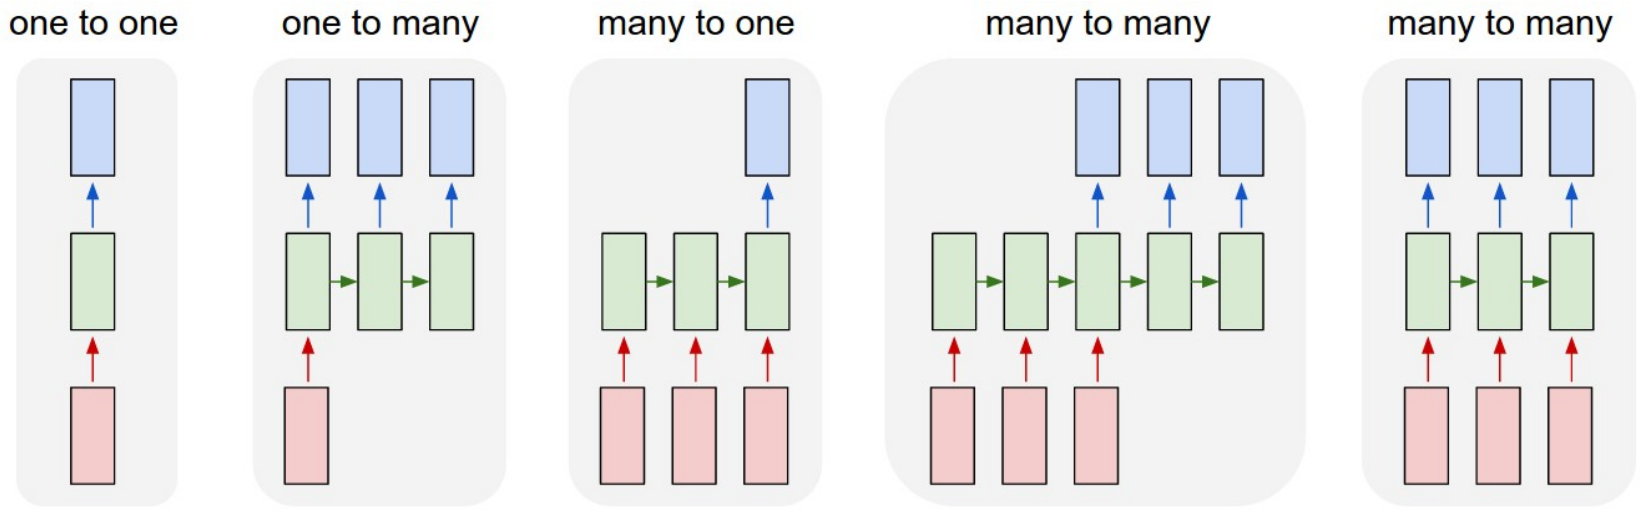
The Unreasonable Effectiveness of Recurrent Neural Networks

May 21, 2015

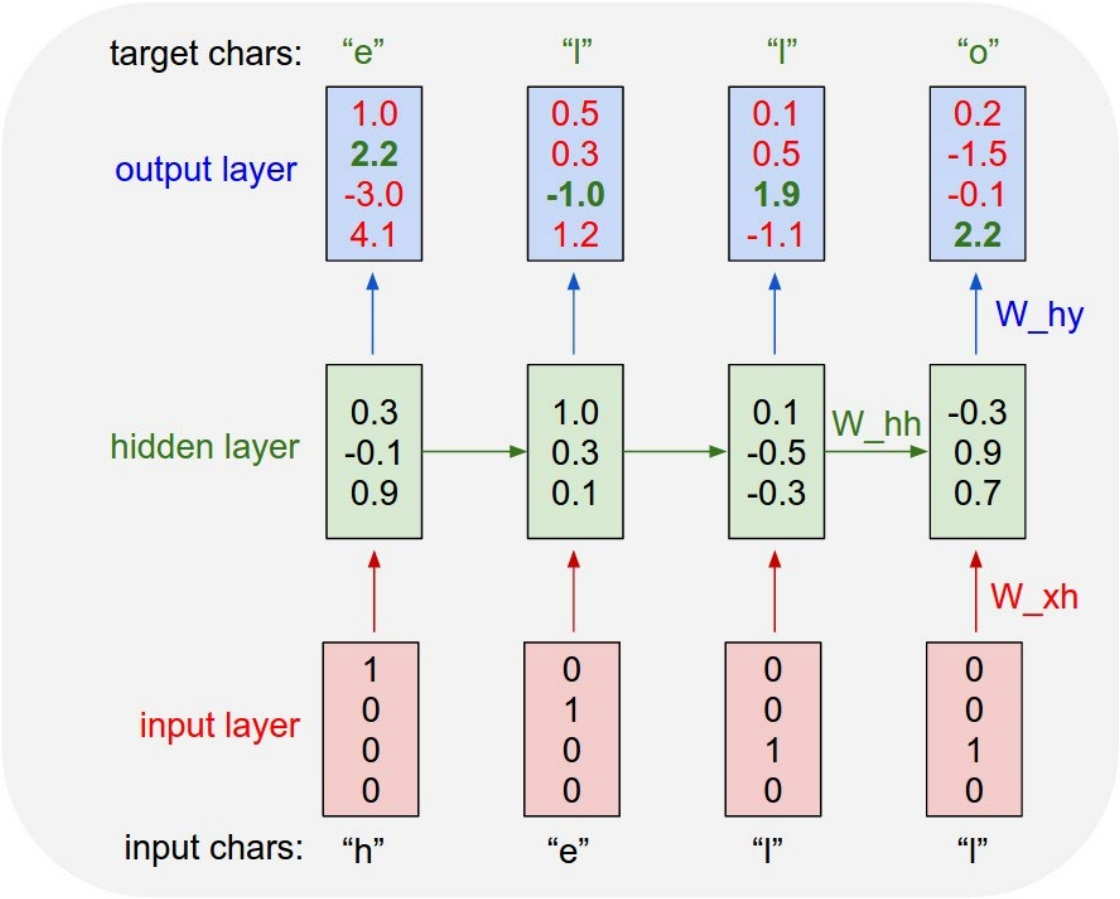
http://karpathy.github.io/2015/05/21/rnn-effectiveness/

https://github.com/karpathy/char-rnn

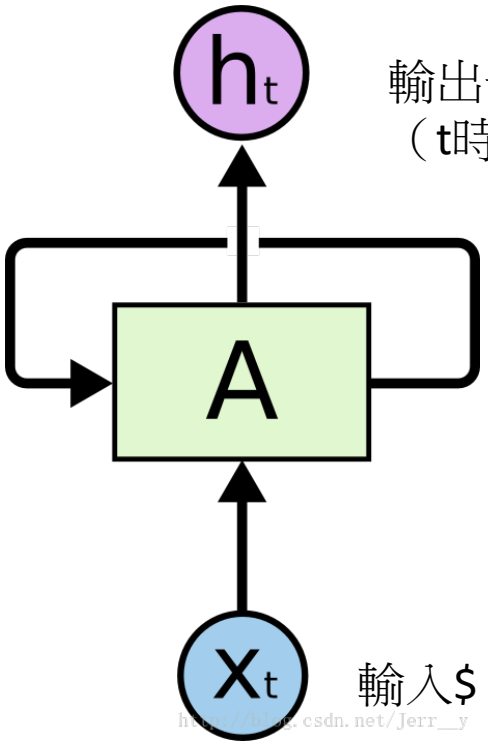


http://karpathy.github.io/2015/05/21/rnn-effectiveness/

An example RNN with 4-dimensional input and output layers, and a hidden layer of 3 units (neurons)



http://karpathy.github.io/2015/05/21/rnn-effectiveness/



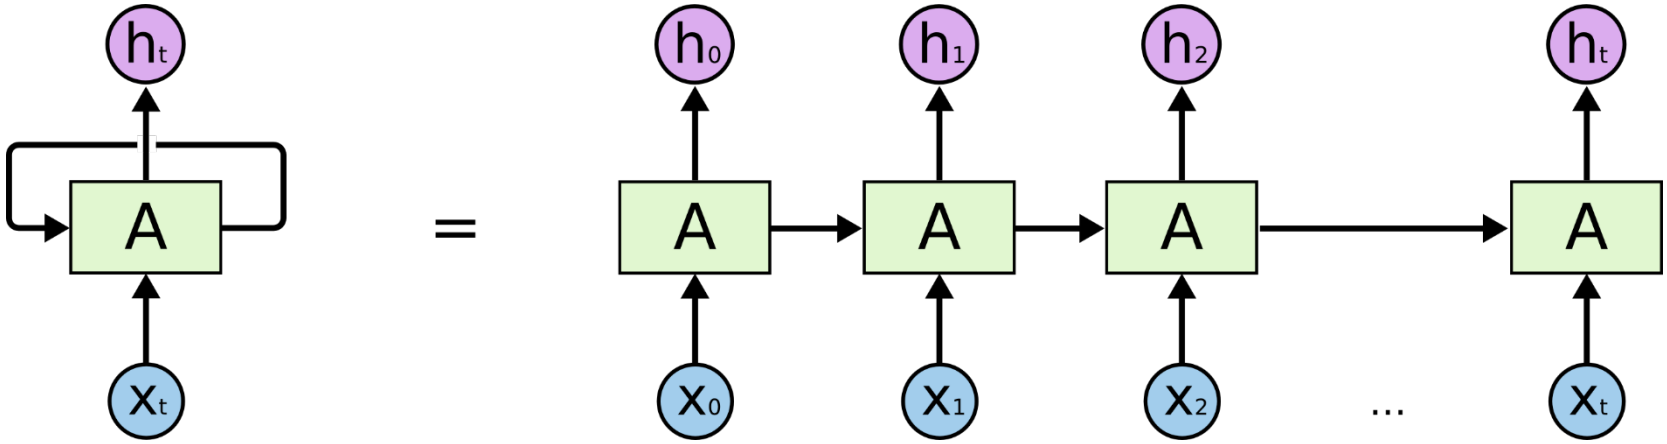
輸出一個結果 h_t $
（t時刻的狀態或者輸出）

網路中的迴圈結構使得某個時刻的狀態能夠傳到下一個時刻

A loop allows information to be passed from one step of the network to the next

輸入$ x_t （t時刻的特徵向量）

A recurrent neural network can be thought of as multiple copies of the same network, each passing a message to a successor.



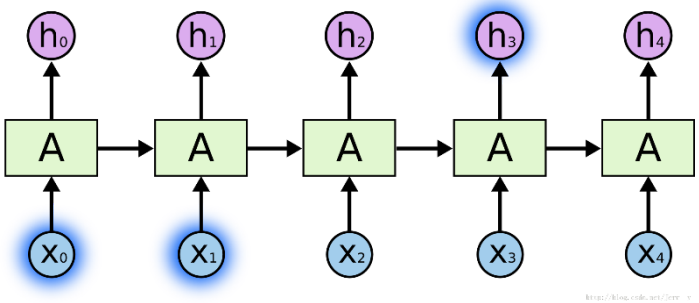
This chain-like nature reveals that recurrent neural networks are intimately related to sequences and lists.

They’re the natural architecture of neural network to use for such data.

The Problem of Long-Term Dependencies

長時期依賴的問題

consider a language model trying to predict the next word based on the previous ones.



the clouds are in the ?

the clouds are in the sky

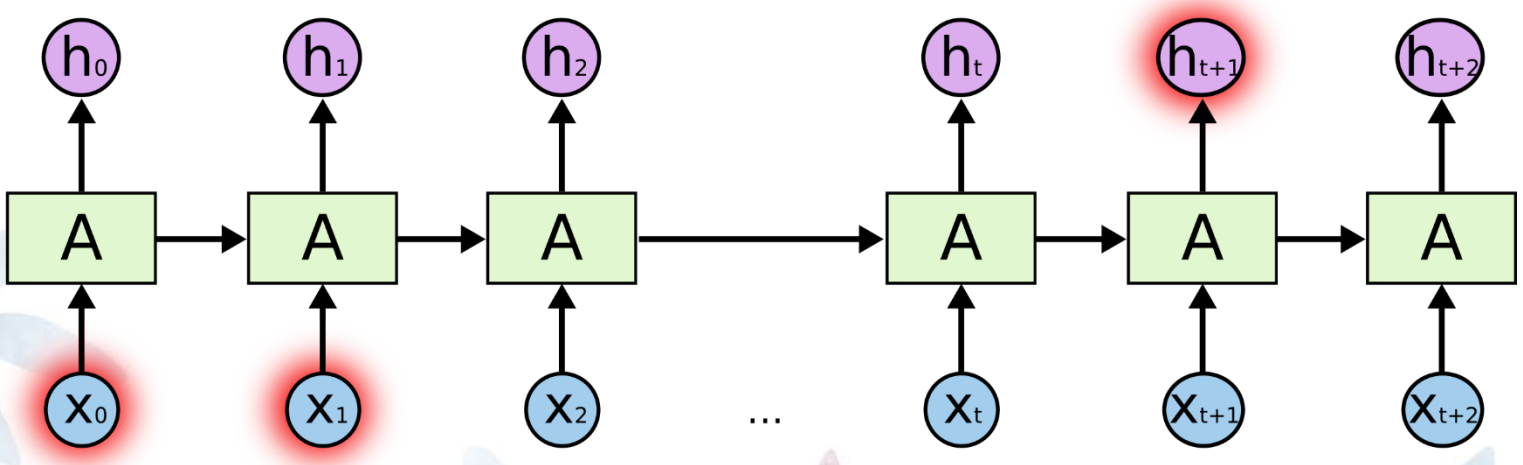
不需要更多的資訊，我們就能夠自然而然的想到下一個詞應該是“sky”。

所要預測的內容和相關資訊之間的間隔很小，這種情況下 RNNs 就能夠利用過去的資訊，很容易的實現

長時期依賴的問題

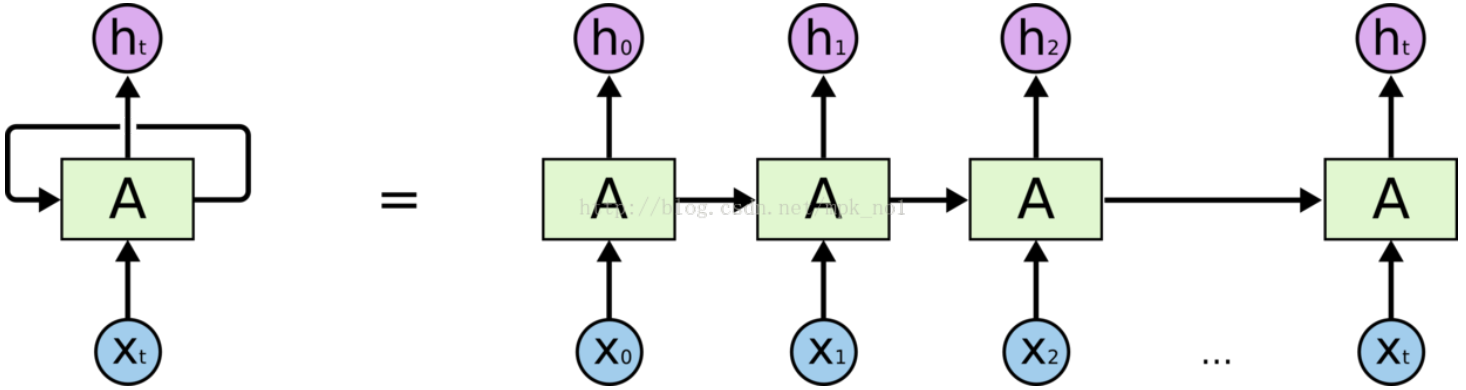
預測 “I grew up in France … (此處省略1萬字)… I speak ?”

“I grew up in France… I speak fluent **French**.”



預測資訊和相關資訊間的間隔增大， RNNs 很難去把它們關聯起來

SimpleRNN



所有迴圈神經網路結構都是由完全相同結構的（神經網路）模組進行複製而成的。在普通的RNNs 中，這個模組結構非常簡單，比如僅是一個單一的 tanh 層

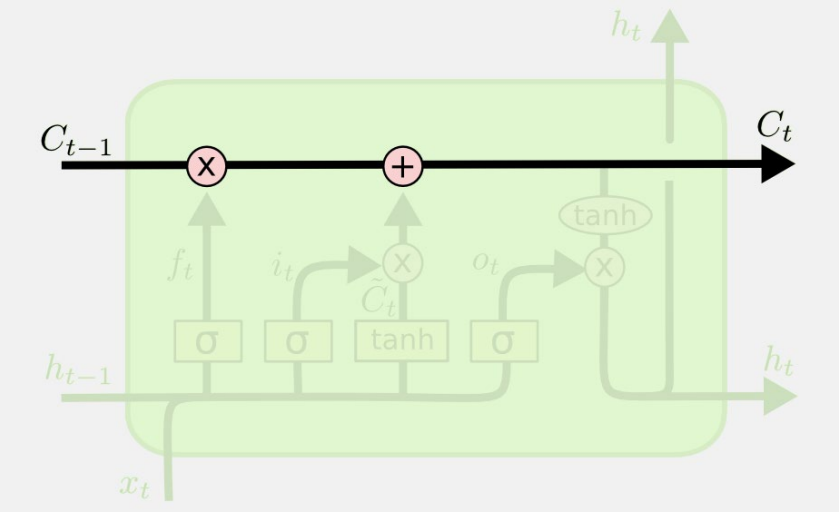
cell state

長時期的記憶保留

LSTMs 最關鍵的地方在於 cell 狀態 和 結構圖上面的那條橫穿的水平線。

cell 狀態的傳輸就像一條傳送帶，向量從整個 cell 中穿過，只是做了少量的線性操作。這種結構能夠很輕鬆地實現資訊從整個 cell 中穿過而不做改變。（這樣就可以實現長時期的記憶保留）

傳送帶結構



使用Gate來添加或者刪除資訊

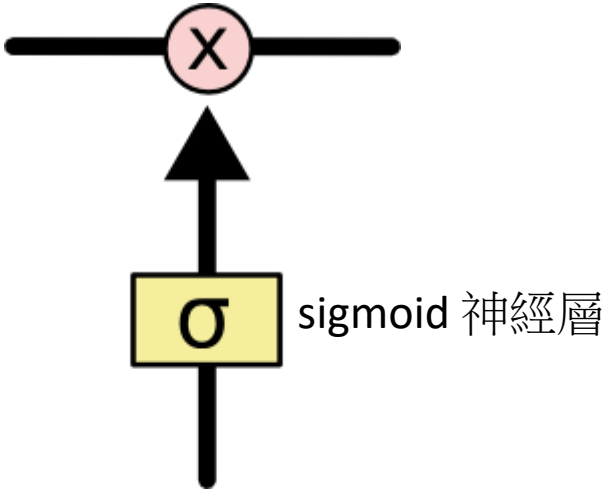
每個 LSTM 有三個這樣的門結構，來實現保護和控制資訊。
（分別是 “forget gate layer”, 遺忘門； “input gate layer”，傳入門；
“output gate layer”, 輸出門）

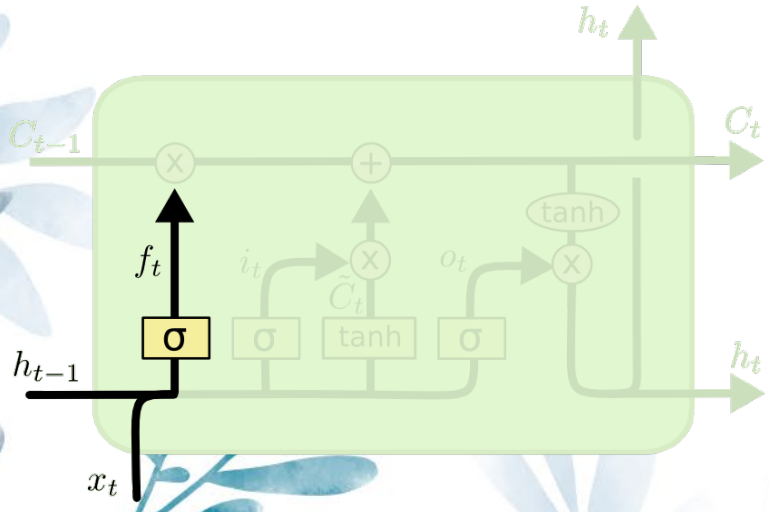
遺忘門 (forget gates)

決定要讓那些資訊繼續通過這個 cell?

sigmoid 神經層
輸出是一個數值都在 0，1 之間的向量（向量長度和 cell 的狀態 $ C_{t-1} $ 一樣），表示讓 $C_{t-1} $ 的各部分資訊通過的比重。
0 表示“不讓任何資訊通過”， 1 表示“讓所有資訊通過”。

pointwise multiplication operation



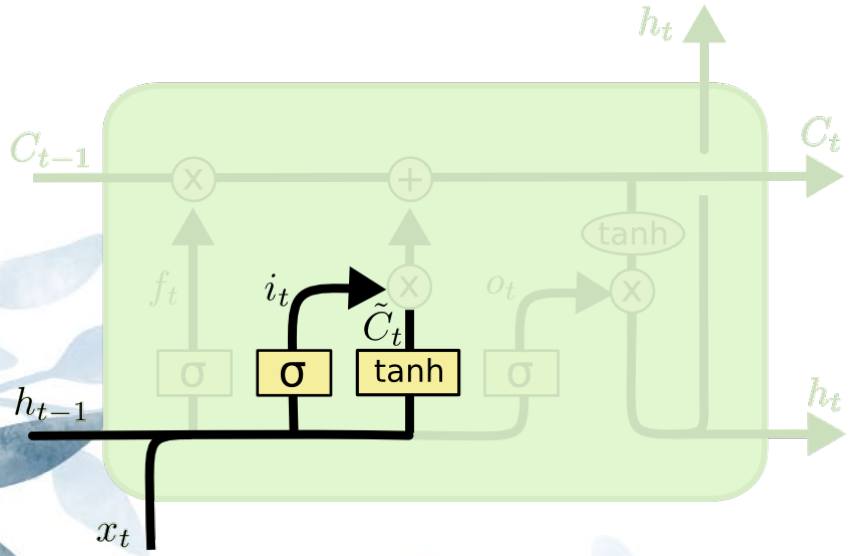


$$f_t = \sigma\left(W_f \cdot [h_{t-1}, x_t] \; + \; b_f\right)$$

傳入門 (input gates)

決定讓多少新的資訊加入到 cell 狀態

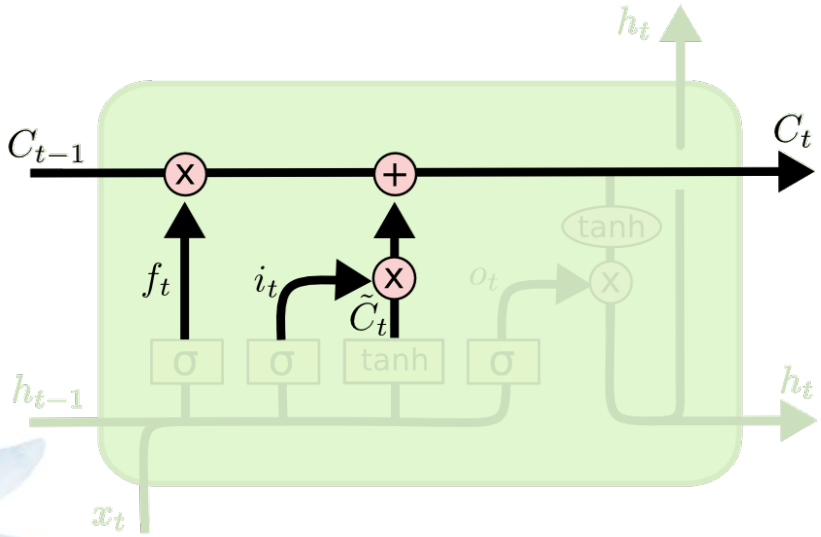
[1]a sigmoid layer called the “input gate layer” decides which values we’ll update.
[2]a tanh layer creates a vector of new candidate values, C~t, that could be added to the state



$$i_t = \sigma\left(W_i \cdot [h_{t-1}, x_t] \; + \; b_i\right)$$

$$\tilde{C}_t = \tanh(W_C \cdot [h_{t-1}, x_t] \; + \; b_C)$$

combine these two to create an update to the state



$$C_t = f_t * C_{t-1} + i_t * \tilde{C}_t$$

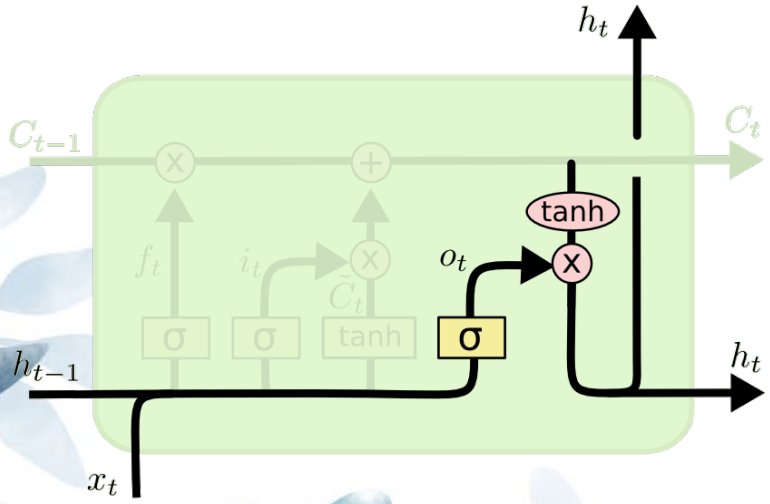
輸出門

決定輸出什麼值

This output will be based on our cell state, but will be a filtered version

First, we run a sigmoid layer which decides what parts of the cell state we're going to output.

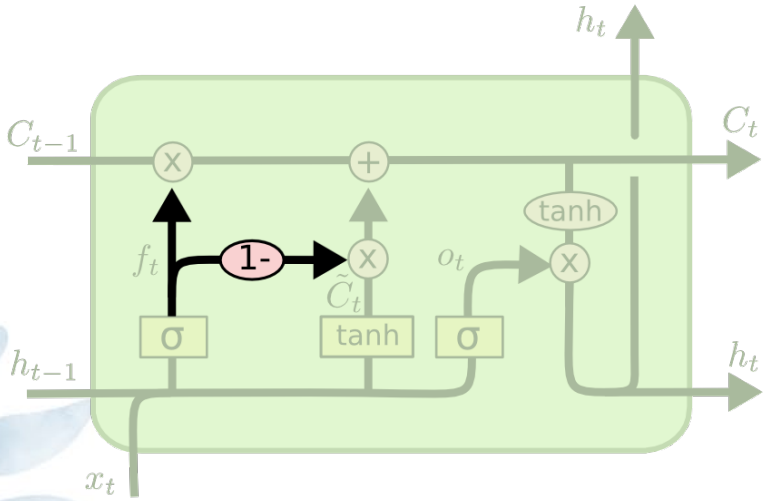
Then, we put the cell state through tanh (to push the values to be between −1 and 1) and multiply it by the output of the sigmoid gate, so that we only output the parts we decided to.



$$o_t = \sigma\left(W_o\left[h_{t-1}, x_t\right] + b_o\right)$$

$$h_t = o_t * \tanh\left(C_t\right)$$

Depth-Gated Recurrent Neural Networks



$$C_t = f_t * C_{t-1} + (1 - \boldsymbol{f_t}) * \tilde{C}_t$$

Towards Automated Classification of Attackers' TTPs by combining NLP with ML Techniques

Clemens Sauerwein, Alexander Pfohl

The increasingly sophisticated and growing number of threat actors along with the sheer speed at which cyber attacks unfold, make timely identification of attacks imperative to an organisations' security. Consequently, persons responsible for security employ a large variety of information sources concerning emerging attacks, attackers' course of actions or indicators of compromise. However, a vast amount of the needed security information is available in unstructured textual form, which complicates the automated and timely extraction of attackers' Tactics, Techniques and Procedures (TTPs). In order to address this problem we systematically evaluate and compare different Natural Language Processing (NLP) and machine learning techniques used for security information extraction in research. Based on our investigations we propose a data processing pipeline that automatically classifies unstructured text according to attackers' tactics and techniques derived from a knowledge base of adversary tactics, techniques and procedures.

An Ensemble of Pre-trained Transformer Models For Imbalanced Multiclass Malware Classification

Ferhat Demirkıran, Aykut Çayır, Uğur Ünal, Hasan Dağ

https://arxiv.org/abs/2112.13236

Classification of malware families is crucial for a comprehensive understanding of how they can infect devices, computers, or systems. Thus, malware identification enables security researchers and incident responders to take precautions against malware and accelerate mitigation. API call sequences made by malware are widely utilized features by machine and deep learning models for malware classification as these sequences represent the behavior of malware. However, traditional machine and deep learning models remain incapable of capturing sequence relationships between API calls. On the other hand, the transformer-based models process sequences as a whole and learn relationships between API calls due to multi-head attention mechanisms and positional embeddings. Our experiments demonstrate that the transformer model with one transformer block layer surpassed the widely used base architecture, LSTM. Moreover, BERT or CANINE, pre-trained transformer models, outperformed in classifying highly imbalanced malware families according to evaluation metrics, F1-score, and AUC score. Furthermore, the proposed bagging-based random transformer forest (RTF), an ensemble of BERT or CANINE, has reached the state-of-the-art evaluation scores on three out of four datasets, particularly state-of-the-art F1-score of 0.6149 on one of the commonly used benchmark dataset.

The Analysis of Online Event Streams: Predicting the Next Activity for Anomaly Detection

Suhwan Lee, Xixi Lu, Hajo A. Reijers

https://arxiv.org/abs/2203.09619

Anomaly detection in process mining focuses on identifying anomalous cases or events in process executions. The resulting diagnostics are used to provide measures to prevent fraudulent behavior, as well as to derive recommendations for improving process compliance and security. Most existing techniques focus on detecting anomalous cases in an offline setting. However, to identify potential anomalies in a timely manner and take immediate countermeasures, it is necessary to detect event-level anomalies online, in real-time. In this paper, we propose to tackle the online event anomaly detection problem using next-activity prediction methods. More specifically, we investigate the use of both ML models (such as RF and XGBoost) and deep models (such as LSTM) to predict the probabilities of next-activities and consider the events predicted unlikely as anomalies. We compare these predictive anomaly detection methods to four classical unsupervised anomaly detection approaches (such as Isolation forest and LOF) in the online setting. Our evaluation shows that the proposed method using ML models tends to outperform the one using a deep model, while both methods outperform the classical unsupervised approaches in detecting anomalous events.
